The View Model is a structure that contains information about the user interface of an application. The View Model is a component of the Model-View-Controller (MVC) architectural pattern, which is a design pattern that separates the business logic of an application from the user interface. The View Model is used to store the data that is required by the View to display the information to the user.

The View Model is responsible for providing access to the data that is required by the View to display the information to the user. The View Model is a component of the Model-View-Controller (MVC) architectural pattern, which is a design pattern that separates the business logic of an application from the user interface. The View Model is used to store the data that is required by the View to display the information to the user.
